

nullChat

What is this?

nullChat is a fully decentralized, peer to peer platform built in C++ with Bluetooth & Wifi P2P capabilities. Where users can text chat, send files and talk over VOIP all in a secure and private setting. No one exists, nothing is logged and you are free from prying eyes. Once it's gone, it's gone.

Who would use it?

You can never know who is and who isn't watching and listening in on you, so this software is for people who want to talk/send files to others over a 100% free forever, open source, fully secure platform where they can discuss and keep confidential topics confidential. Built by the people, for the people.

Why not use Signal?

People can of course use Signal if they please, I can't force you to use nullChat. The main difference is like I stated previously, This is by the people, for the people, once you close a chat it's gone forever. Signal's great until their servers get subpoenaed. nullChat has no servers, no logs, no masters, just you and who you trust. No big tech influence to throw the wool over your eyes and tell you that their service is "private" and "secure" when it's not.

You fire it up, it finds peers nearby via Bluetooth or Wi-Fi, you chat, you close, it vanishes.
